

① Blocking & Non-Blocking Assignment

↳ assign $x = (a \& b) | c$

continuously LHS = RHS
+ they are usually used for data-flow modeling

↳ always @(*)
begin
 $y = (a | b) \& c$
end.

→ sensitivity list

procedural assignment lives within
always block

= Blocking
<= Non-Blocking

i.e. will proceed after current statement

we are overwriting

$x = a$
 $x = x \wedge b$
 $x = x | c$

$x <= a$
 $x <= x \wedge b$
 $x <= x | c$

result: $x = (a \wedge b) | c$

+ non-blocking

should not be used
with combinational
